Here's where
the money leaks.

Bali & Phuket Delivery Benchmark 2026

Original data from the restaurants we manage. Keep swiping.

What this is

We manage 96 restaurants on GrabFood and GoFood across Bali and Phuket. We took their GrabMerchant and GoBiz dashboards, anonymised the numbers and published them as market norms.

270,568 orders. January to August 2026. 84 venues in Bali, 12 in Phuket.

Medians, not averages: one large venue distorts a fleet average, while the median shows what an ordinary restaurant actually looks like.

Nobody in Southeast Asia publishes data like this. The platforms included.

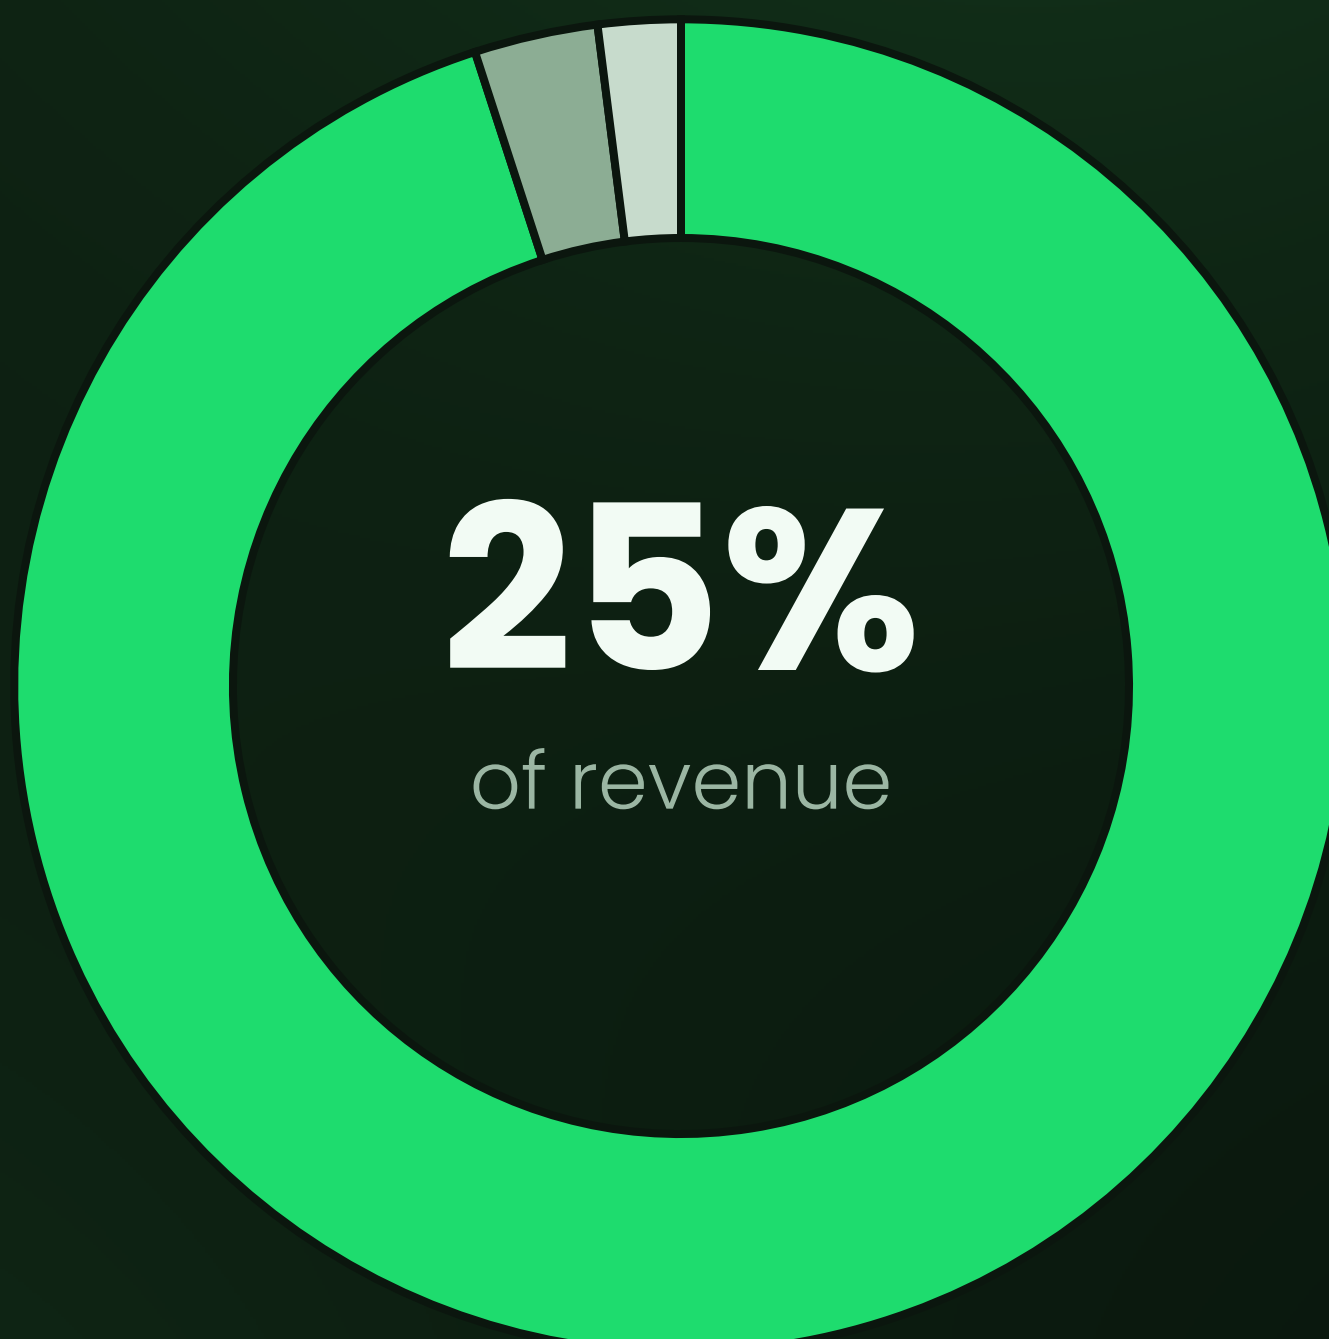

A quarter of revenue leaks away

95%

Out of stock

3% · 2%

Downtime · Cancellations

Restaurants do not lose money while they are closed. They lose it while they are open with half the menu switched off.

The longest a single dish sat out of stock

2,000

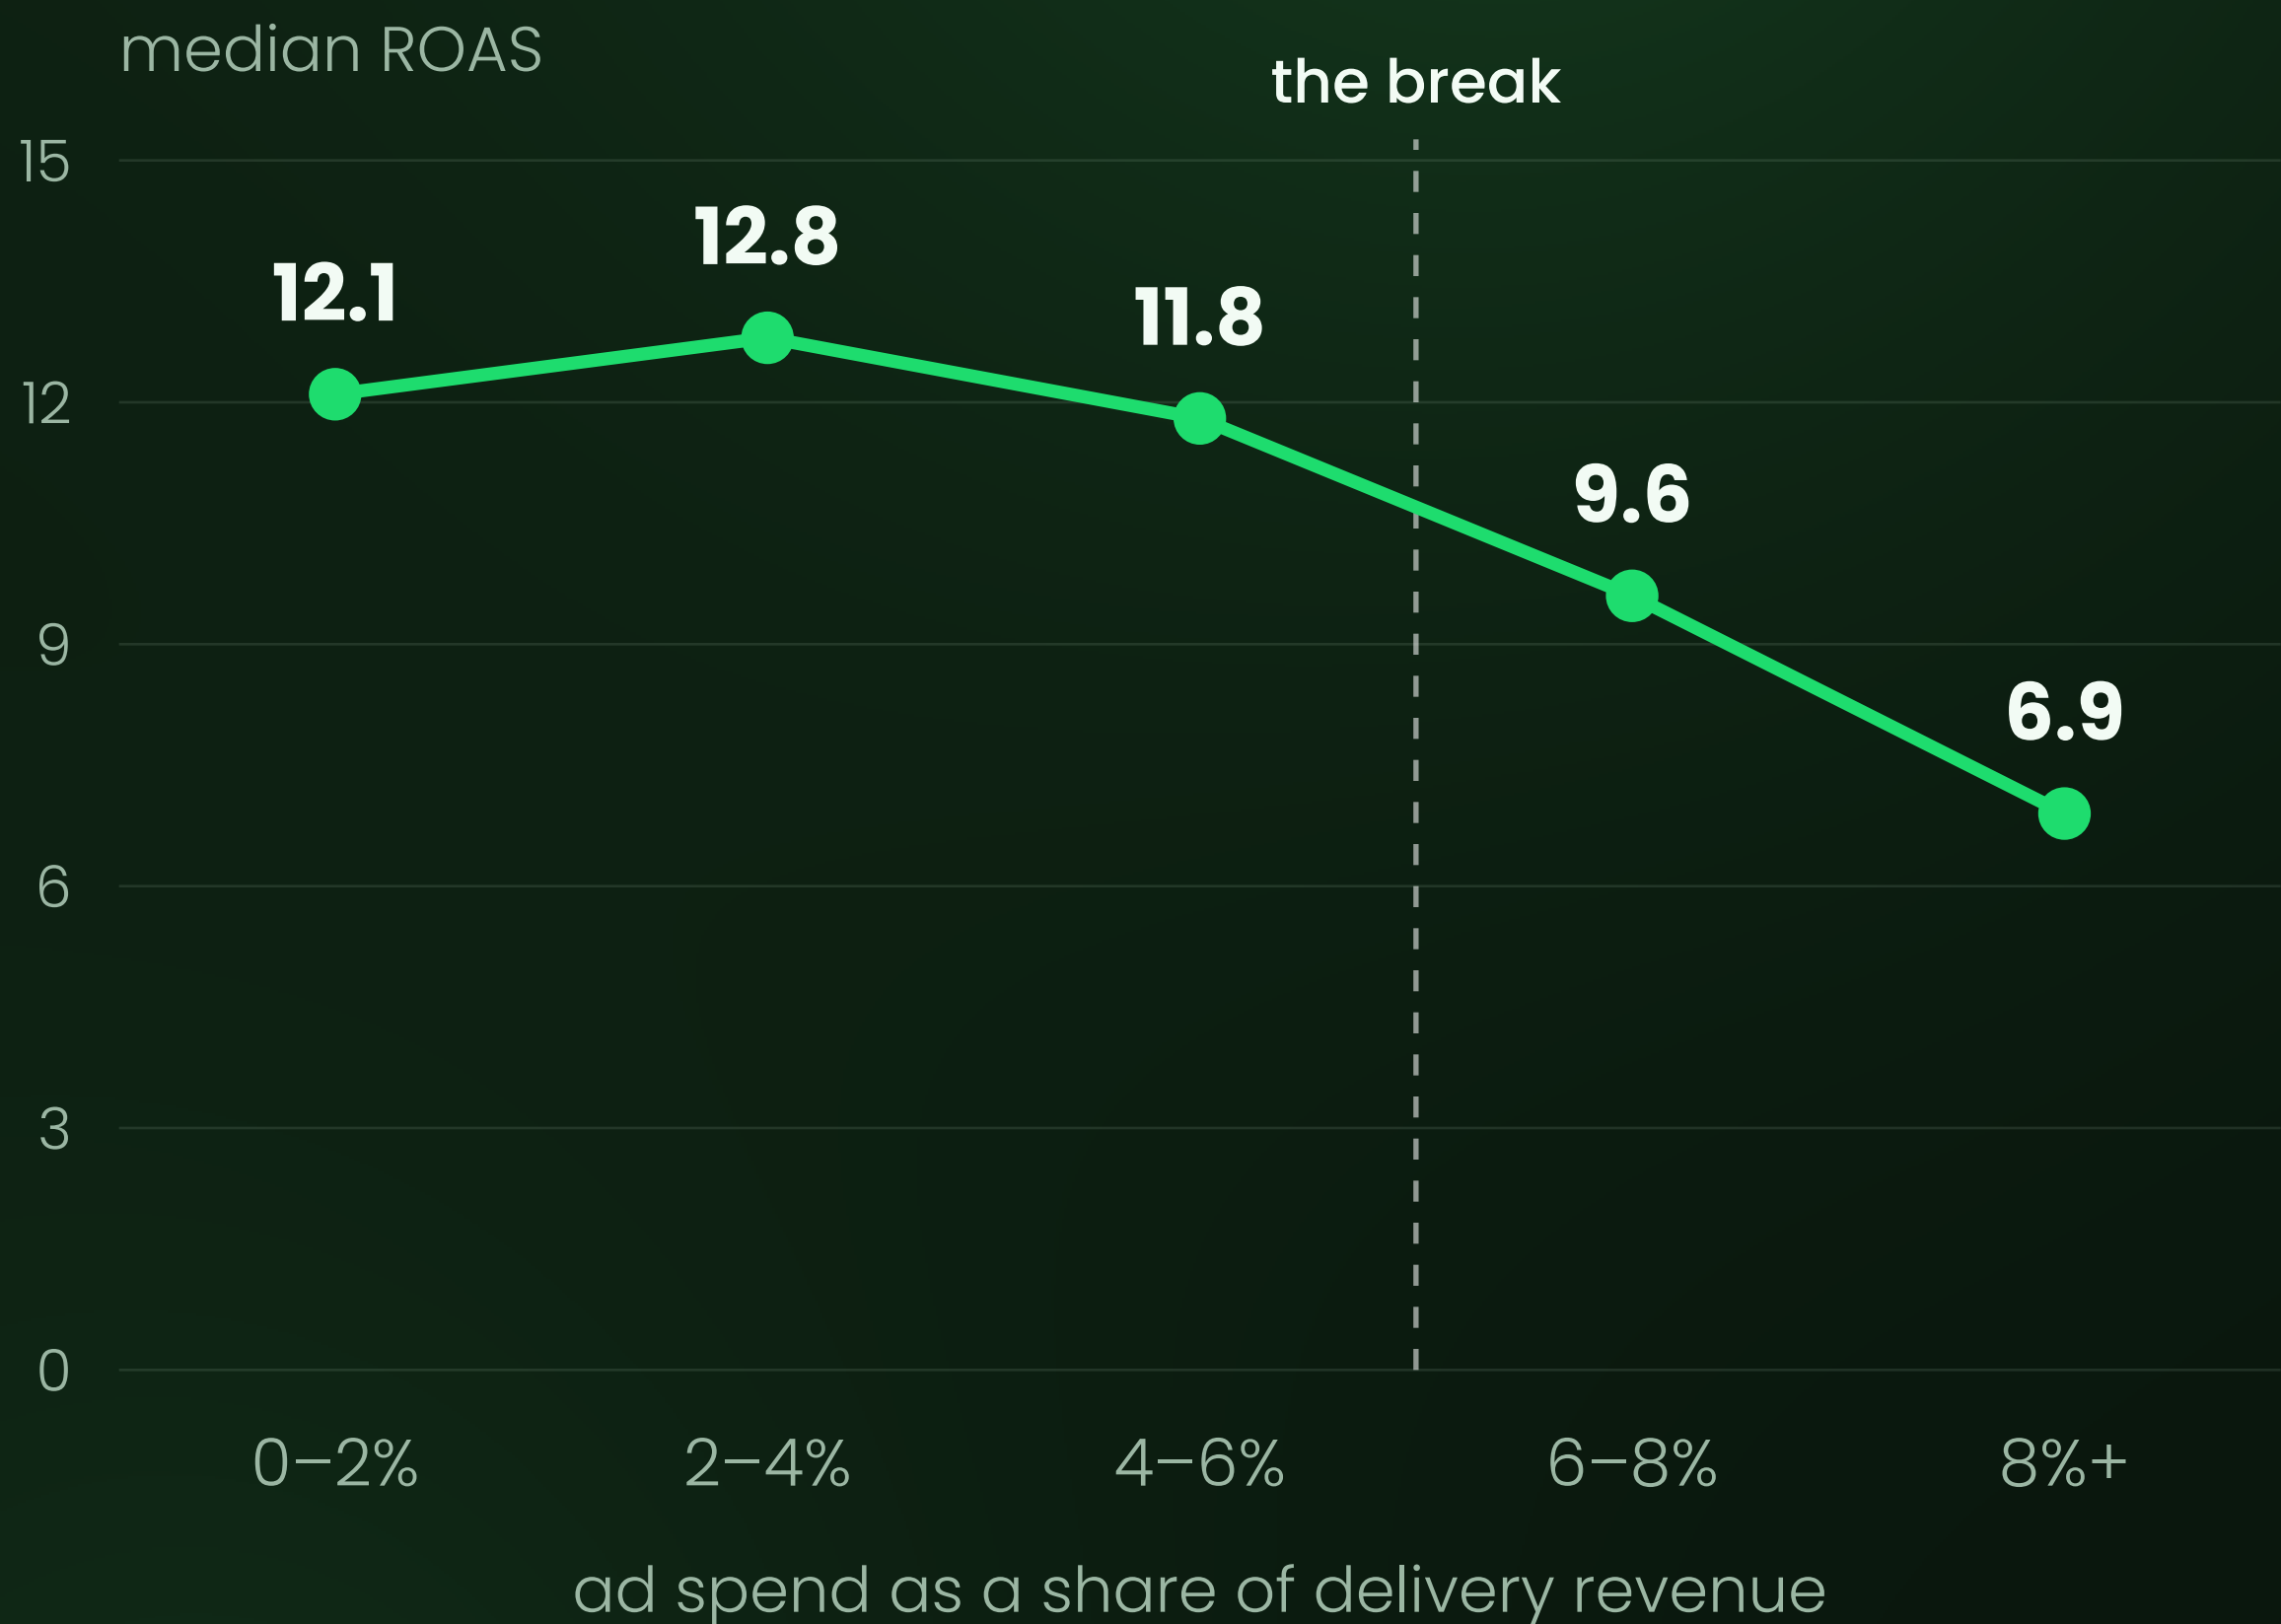

hours

84 days nobody switched it back on.

Individual venues had 40 to 70 items switched off at the same time — while paying for ads to bring people to that menu.

Ads stop paying back after 6% of revenue

Below the line the median ROAS is 12.1x. Above it, 8.6x. 42% of our own fleet is already past that line.

Raise the budget after conversion improves. Not before.

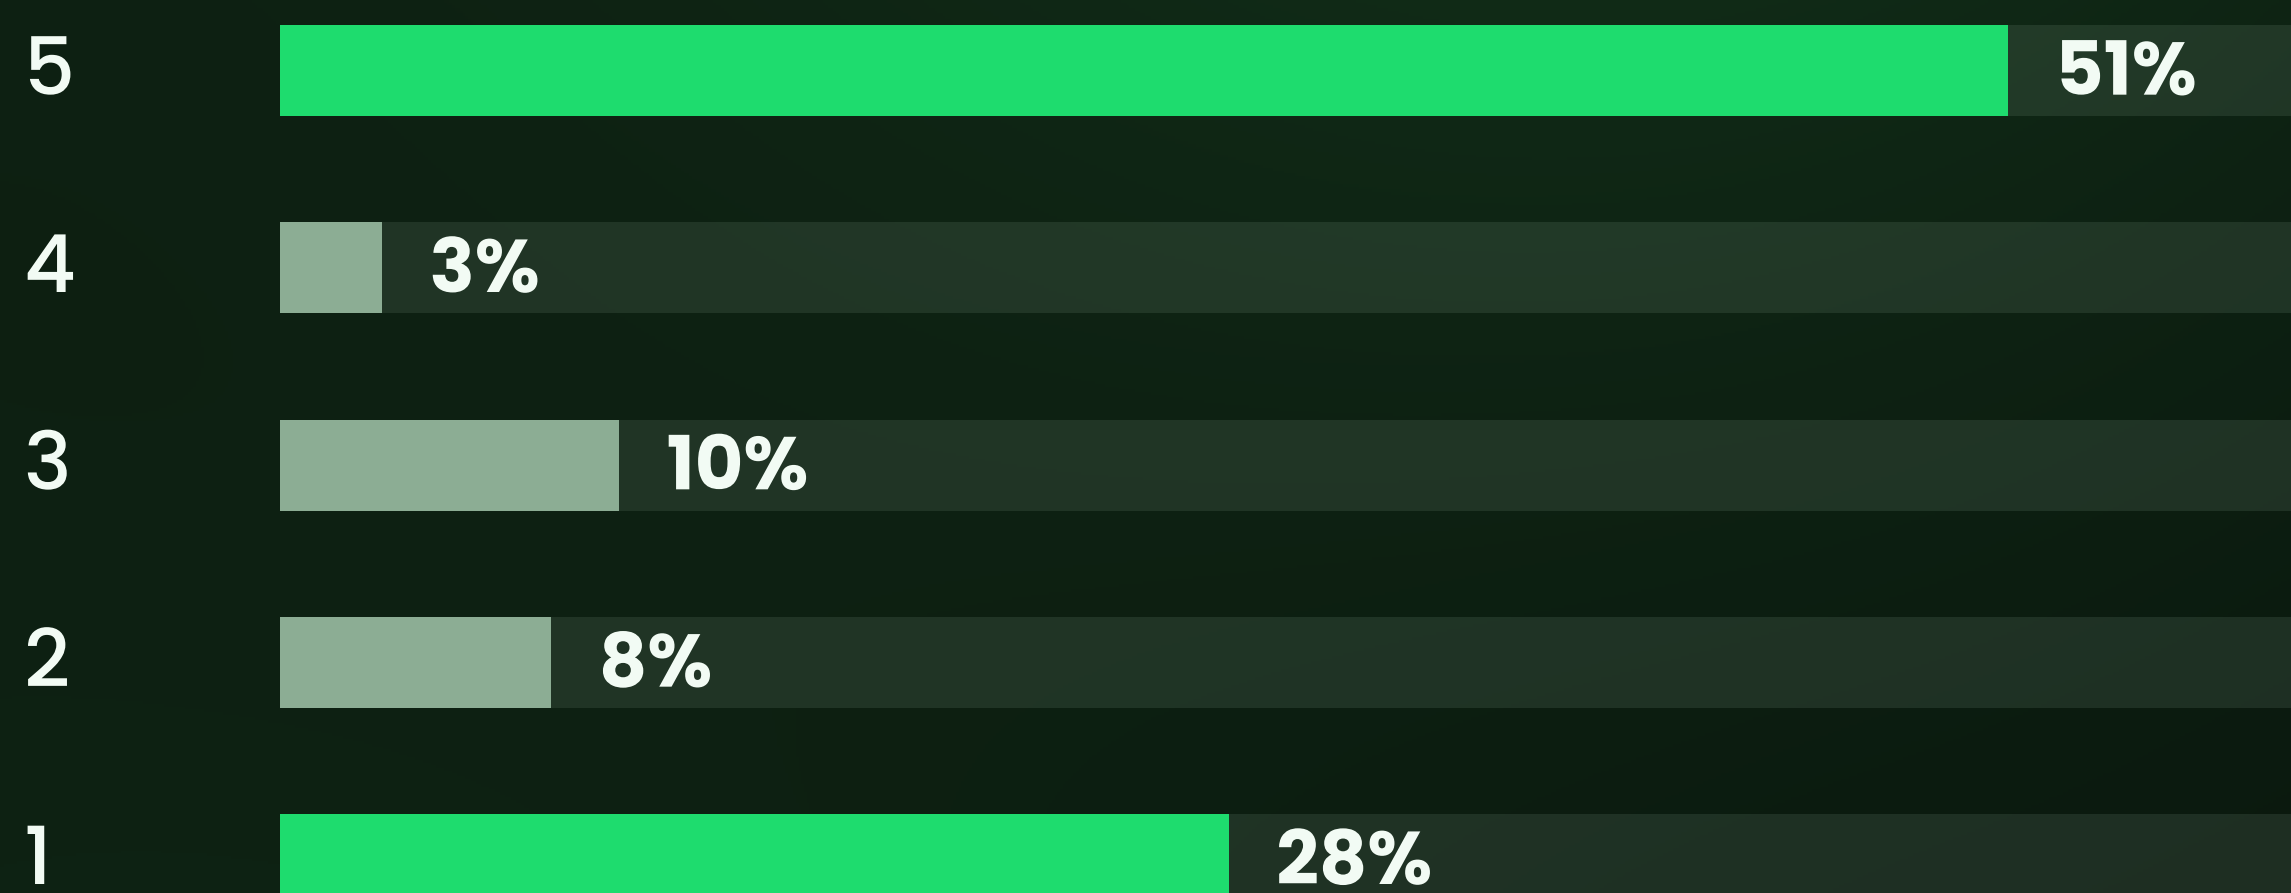

Ads buy impressions. Everything else decides what an impression turns into.

On a listing that converts at 0.5%, every extra dollar buys one more look without an order — only faster.

Grab and Gojek are not ad networks. They earn commission on orders, so ranking follows how well a restaurant monetises their audience. Your bid amplifies a position. It does not create one.

Delivery ratings are bimodal

share of reviews by star rating · 432 reviews, last 30 days

There is no middle. People write when it was excellent or when it was bad.

So a rating moves by removing 1-star reviews, not by improving on average — and about 80% of the unfair reviews we appeal on Grab do get removed.

Bali norms

median across 84 restaurants

Average check	Rp 250k
---------------	----------------

Ads ROAS	10.4x
----------	--------------

Ad spend	5.6% of revenue
----------	------------------------

Cancellations	0.35%
---------------	--------------

Bad reviews	1 per 138 orders
-------------	-------------------------

Only 6% of the fleet runs below a 5x ROAS. If yours is lower, that is not the market — it is something broken in the listing, the bidding or the promos.

Bali vs Phuket

	Bali	Phuket
Median check	\$15.2	\$22.5
Median ROAS	10.4x	22.8x
Ad spend	5.5%	2.9%
Revenue leakage	25%	6%

Phuket looks like Bali a few years earlier: checks half as high again, ads half as expensive relative to revenue and paying back twice as well.

The difference is not restaurant quality. It is market saturation — numbers that count as normal on one island do not transfer to the other.

The caveat we put on the page

This is a sample of agency-managed restaurants, not a random sample of the market. It is biased toward venues that are being watched.

Real market stock-out losses are almost certainly worse than our 25%.
